Problem Set 1

Applied Stats/Quant Methods 1

Due: October 1, 2023

Instructions

- Please show your work! You may lose points by simply writing in the answer. If the problem requires you to execute commands in R, please include the code you used to get your answers. Please also include the .R file that contains your code. If you are not sure if work needs to be shown for a particular problem, please ask.
- Your homework should be submitted electronically on GitHub.
- This problem set is due before 23:59 on Sunday October 1, 2023. No late assignments will be accepted.
- Total available points for this homework is 80.

Question 1 (40 points): Education

A school counselor was curious about the average of IQ of the students in her school and took a random sample of 25 students' IQ scores. The following is the data set:

1. Find a 90% confidence interval for the average student IQ in the school.

```
7 se<-sd/sqrt(n)
8 #degrees of freedom
9 df<-n-1
10 #calculate t_value
11 t_value<-qt(0.95,df)
12 #margin of error
13 me<-t_value*se
14 #calculate confidence interval
15 a<-mean-me
16 b<-mean+me
17 #result
18 cat("The 90% confidence interval is (",a,"",",b,")")</pre>
```

- Results: the confidence interval is (93,102)
- 2. Next, the school counselor was curious whether the average student IQ in her school is higher than the average IQ score (100) among all the schools in the country. Using the same sample, conduct the appropriate hypothesis test with $\alpha = 0.05$. set

assumptions, H0: the average student IQ in her school is not higher than the average IQ among all the schools in the country; Ha:the average student IQ in her school is higher than the average IQ among all the schools in the country;

- Results: we accept the Ha, means the average student IQ in her school is higher than the average IQ among all the schools in the country.

Question 2 (40 points): Political Economy

Researchers are curious about what affects the amount of money communities spend on addressing homelessness. The following variables constitute our data set about social welfare expenditures in the USA.

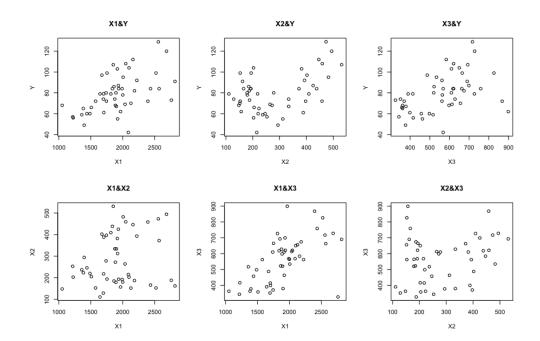

Explore the expenditure data set and import data into R.

```
for(j in all_correlation_coes){
```

• Please plot the relationships among Y, X1, X2, and X3? What are the correlations among them (you just need to describe the graph and the relationships among them)?

```
expenditure <- read.table("https://raw.githubusercontent.com/ASDS-TCD/
      StatsI_Fall2023/main/datasets/expenditure.txt", header=T)
_{2} par (mfrow=c (2,3))
з #X1_Y
4 X1_Y<-plot (expenditure $X1, expenditure $Y, main="X1&Y", xlab="X1", ylab="Y")
5 X1 Y
6 #X2_Y
7 X2_Y<-plot (expenditure $X2, expenditure $Y, main="X2&Y", xlab="X2", ylab="Y")
8 X2 Y
9 #X3_Y
10 X3_Y<-plot (expenditure $X3, expenditure $Y, main="X3&Y", xlab="X3", ylab="Y")
11 X3_Y
12 #X1_X2
13 X1_X2<-plot (expenditure $X1, expenditure $X2, main="X1&X2", xlab="X1", ylab="X2
14 X1 X2
15 #X1_X3
16 X1_X3<-plot (expenditure $X1, expenditure $X3, main="X1&X3", xlab="X1", ylab="X3"
17 X1_X3
18 #X2_X3
19 X2_X3<-plot (expenditure $X2, expenditure $X3, main="X2&X3", xlab="X2", ylab="X3"
20 X2_X3
```

```
_{21} par (mfrow=c (1,1))
22 #check correlations
  all_correlation_coes<-c(cor(expenditure $X1, expenditure $Y), cor(expenditure
      $X2, expenditure $Y), cor (expenditure $X3, expenditure $Y), cor (expenditure $
      X1, expenditure $X2), cor (expenditure $X1, expenditure $X3), cor (expenditure $
      X2, expenditure $X3))
  all_correlation_coes
  for(j in all_correlation_coes){
     if(j>=0)
26
       if(j>0){
27
         print("positive correlation")
28
29
       }else{
         print("irrelevant")
30
31
    }else{
32
       print("negative correlation")
34
35
```

- Results: from the images above, the person correlation coefficients individually are 0.53,0.45,0.46,0.21,0.6,0.22,which are all greater than zero, so they are all "positive correlation".
- Please plot the relationship between Y and Region? On average, which region has the highest per capita expenditure on housing assistance?

```
Region_1<-mean(expenditure[expenditure$Region == 1,] $$
```

```
Region 2<-mean (expenditure [expenditure $\text{Region} = 2,]

$\frac{\$Y}{\}$

Region 3<-mean (expenditure [expenditure $\text{Region} = 3,]

$\frac{\$Y}{\}$

Region 4<-mean (expenditure [expenditure $\text{Region} = 4,]

$\frac{\$Y}{\}$

region cat = c("1", "2", "3", "4")

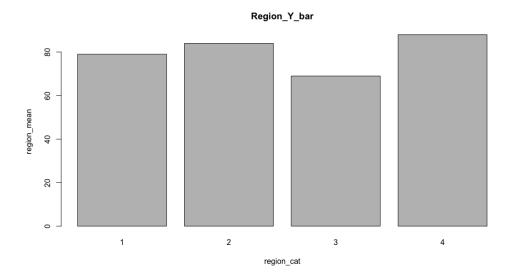

region mean = c(79, 84, 69, 88)

Region Y_bar<-barplot (region mean, names.arg = region_cat, main = "Region_Y_bar",

$\frac{\$X}{\}$

xlab = "region_cat", ylab = "region_mean")

result<-cat("the region of NO.4 has the highest per capita expenditure on housing assistance")
```

- Results: On average, the forth region has the highest per capita expenditure on housing assitance.
- Please plot the relationship between Y and X1? Describe this graph and the relationship. Reproduce the above graph including one more variable Region and display different regions with different types of symbols and colors.

```
library(ggplot2)
ggplot(expenditure, aes(x=X1,y=Y, color=factor(Region), shape=factor(Region)
))+geom_point()+
labs(x="income",y="expenditure")+scale_color_manual(values=c("1"="pink","2"="orange","3"="red","4"="blue"))+
scale_shape_manual(values=c("1"="10","2"="12","3"="14","4"="16"))+
theme_minimal()
```

- ERRORS: cannot produce image due to some errors.
